## Introduction & Objective

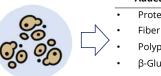

The food industry generates substantial amounts of food waste with significant environmental impact,

Brewer's spent yeast (BSY) stands out as a significant residue from the brewing process, typically ranging from 2.0 to 4.0 kilograms per 100 litters of beer produced,

It is imperative for industries to devise innovative solutions to manage these byproducts.

The present work aimed to valorise BSY byproduct into high-value products suitable for diverse food applications. We employed an innovative green extraction process to obtain BSY extracts enriched with bioactive compounds: Added value products

Proteins & Peptides

- Polyphenols
- **B**-Glucans

Methodology

1. The proximate composition was analysed according to AOAC official methods. Dietary fibre was determined by the enzymatic gravimetric method (Megazyme kit).

2. Following the washing treatment (1:2 v/w, 5000 rpm, 4°C), the solid fraction underwent to an autolysis process at 70°C for 5 hours

3. We applied tangential membrane filtration to produce different BSY extracts, using a membrane molecular weight cutoff of 50 kDa and 10 kDa.

4. Size exclusion high-performance liquid chromatography (SE-HPLC) analysis and bioactivity evaluation were performed considering both antioxidants (ORAC, ABTS).

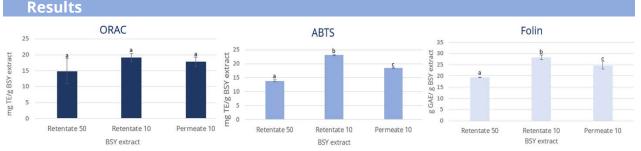

Figure 1 - Antioxidant capacity (ORAC and ABTS assays) and Total phenolic compounds (Folin-Ciocalteu method) of the different BSY extracts. Data are shown as the mean  $\pm$  SD from three replicates. Different letters represent the significant difference at p < 0.05.

Results indicated that both methods revealed strong antioxidant characteristics in all BSY extract fractions. ORAC analysis showed no significant differences between samples, but ABTS analysis did show significant differences (p<0.05), highlighting the higher antioxidant activity in the Retentate 10 kDa extract. This result correlates with the amount of phenolic compounds present in each fraction.

		SE-HPLC analysis				
BSY Proximate Composition (g/100g D.W.)		100	19	33		
Moisture	84.1 ± 0.05	80 —	29		44	= <1 kDa ≡ 1-3 kDa
Ash	$5.52 \pm 0.02$	0 60				
Proteins	43.6 ± 0.45	0 % ratio	14	44		# 3-5 kDa
Lipids	2.51 ± 0.01	8 <sup>40</sup>	15		50	<ul> <li>5-10 kDa</li> <li>10-50 kDa</li> </ul>
Carbohydrates	$48.4 \pm 0.48$	20	15	9		≡ >50 kDa
Total Dietary fibre	$0.47 \pm 0.59$		8	9	4	
		0	Retentate 50kDa	Permeate 50kDa Retentate 10kDa	Permeate 10kDa	

- SE-HPLC results show variability in peptide sizes, revealing the composition of the hydrolysates. The 10 kDa permeate had the highest proportion of smaller peptides (<1 kDa and 1-3 kDa).
- The BSY by-product shows a high content of proteins and total carbohydrates.

## Conclusion

This work is align with the United Nations Sustainable Development Goals, particularly Goal 3 and Goal 12 by producing protein extracts from sustainable sources and using by-products like BSY to promote a circular economy in the food industry.

Figure 2- SE-HPLC of BSY extracts profile.

High-protein BSY extracts, suitable for potential applications into functional food matrices, were successfully produced.
